Mark Struberg / INSO, TU Vienna

CDI Experts – DI hard!

About Myself

- struberg@yahoo.de
- struberg@apache.org
- <http://github.com/struberg>
- freelancer, programmer since 20 years
- elected Apache Software Foundation member
- Apache OpenWebBeans PMC + PMC and committer in other ASF projects: MyFaces, BVAL, OpenJPA, maven, ...
- CDI EG member

How the ASF works

- Non profit Organization
- Contributors
- Committers
- PMC member
(Project Management Committee)
- ASF member
- ASF board of directors

Agenda

- JSR-299 Overview
- Basic CDI Concepts
- Producers
- Alternatives
- Interceptors
- Events
- Extensions
- JSR-346 (CDI-1.1) preview

JSR-299 Overview

- Contexts and Dependency Injection for the Java EE platform (CDI)
- Component Model for Java (SE and EE)
- The spec formerly known as „WebBeans“
- Started ~2007
- Originally designed for J2EE but also usable for standalone applications
- Based on JSR-330

CDI Features

- Typesafe Dependency Injection
- Interceptors
- Decorators
- Events
- SPI for implementing Portable Extensions
- Unified EL integration

Available Implementations

- JBoss Weld (RI)
- Apache OpenWebBeans
- Resin CanDI
- maybe Spring in the future?

Basic CDI Concepts

What is Dependency Injection?

- Uses Inversion Of Control pattern for object creation
- Hollywood Principle: don't call us, we call you
- No more hardcoded dependencies when working with Interfaces

```
MailService ms = new VerySpecialMailService();
```

Why use Dependency Injection

- Easy to change implementations
- Encourage Separation of Concerns
- Minimise dependencies
- Dynamic Object retrieval
- Makes Modularisation easy
- Simplifies Reusability

Valid Bean Types

- Almost any plain Java class (POJO)
- EJB session beans
- Objects returned by producer methods or fields
- JNDI resources (e.g., DataSource)
- Persistence units and persistence contexts
- Web service references
- Remote EJB references
- Additional Types defined via SPI

A small Example

- Create a META-INF/beans.xml marker file
- Create a MailService implementation

```
@ApplicationScoped
```

```
public class MyMailService
    implements MailService {
    public send(String from, String to,
               String body) {
        .. do something
    }
}
```

A small Example

- We also need a User bean

```
@SessionScoped
```

```
@Named
```

```
public class User {  
    public String getName() {...}  
    ...  
}
```

A small Example

- Injecting the Bean

```
@RequestScoped  
@Named( „mailForm“ )  
public class MailFormular {  
    private @Inject MailService mailSvc;  
    private @Inject User usr;  
    public String sendMail() {  
        mailSvc.send(usr.getEmail(),  
                    „other“, „sometext“);  
        return „successPage“;  
    }  
}
```

A small Example

- Use the beans via Expression Language

```
<h:form>  
    <h:outputLabel value="username"  
        for="username" />  
    <h:outputText id="username"  
        value="#{user.name}" />  
    <h:commandButton value="Send Mail"  
        action="#{mailForm.sendMail}" />  
</h:form>
```

How DI containers work

- Contextual Instance factory pattern
- Someone has to trigger the instance creation
 - even in a DI environment
- But the trigger has no control over the Implementation class nor Instance

'Singletons', Scopes, Contexts

- Each created Contextual Instance is a 'Singleton' in a well specified Context
- The Context is defined by it's Scope
 - `@ApplicationScoped -> ApplicationSingleton`
 - `@SessionScoped -> SessionSingleton`
 - `@ConversationScoped -> ConversationSingleton`
 - `@RequestScoped -> RequestSingleton`
 - ... code your own ...

Built In Scopes

- `@ApplicationScoped`
- `@SessionScoped`
- `@RequestScoped`
- `@ConversationScoped`
- All those scopes are of type `@NormalScope`

Special Scopes

- **@Dependent**
 - Pseudo scope
 - If injected, the Contextual Instance will get/use the Context of it's parent
- **@Dependent** is assumed if no other Scope is explicitly assigned to a class!

Terms – „Managed Bean“

- The term Managed Bean means a Java Class and all it's rules to create contextual instances of that bean.
- Interface
`Bean<T> extends Contextual<T>`
- 'Managed Beans' in JSR-299 and JSR-346 doesn't mean JavaBeans!

Terms – Contextual Instance

- The term 'Contextual Instance' means a Java instance created with the rules of the Managed Bean Bean<T>
- Contextual Instances usually don't get injected directly!

Terms – Contextual Reference

- The term 'Contextual Reference' means a proxy for a Contextual Instance.
- Proxies will automatically be created for injecting @NormalScope beans.

How Proxies work

- 'Interface Proxies' vs 'Class Proxies'
- Generated subclasses which overload all non-private, non-static methods.

```
public doSthg(parm) {  
    getInstance( ).doSthg( );  
}  
private T getInstance( ) {  
    beanManager.getContext( ).get( . . . );  
}
```

- Can contain Interceptor logic

Why use Proxies

- scope-differences - this happens e.g. if a `@SessionScoped` User gets injected into a `@ApplicationScoped` MailService.
- Passivation of non-serializable contextual instances (via it's contextual reference)
- Interceptors, Decorators

The big picture

- Creating the meta information at startup
 - Classpath Scanning and creating Managed Beans meta-information
- Contextual Instance creation at runtime
 - Based on the Managed Beans, the Context will maintain the instances
- Well defined contextual instance termination

homework: some hacking

- Create a new project from a maven archetype

```
$> mvn archetype:generate -DarchetypeCatalog=  
http://people.apache.org/~jakobk/m2_archetypes_103_  
release
```

- Select 'myfaces-archetype-codi-jsf20'
- start the web application in jetty

```
$> mvn clean install -PjettyConfig jetty:run-  
exploded
```

```
$> tree src
```

Qualifiers

- A Qualifier enables the lookup of specific Implementations at runtime
- Qualifier connects 'creation info' with InjectionPoints.
- Kind of a typesafe 'naming' mechanism

Builtin Qualifiers

- **@Named** – used to supply an EL name
- **@Default** - Assumed, if no other Qualifier (beside @Named) is specified
- **@Any** – matches all Qualifiers

Using Qualifiers

- Qualifiers can be used to distinct between beans of the same Type

```
private @Inject @Favourite Track;
```

```
private @Inject @Recommended Track;
```

- Special Qualifier **@Named** for defining EL names.

Define your own Qualifiers

- Creating own annotations will get your daily bread and butter

```
@Qualifier
```

```
@Retention(RUNTIME)
```

```
@Target({TYPE, METHOD, FIELD, PARAMETER})
```

```
public @interface Favourite {}
```

Producers

- Write producer methods or producer fields if more logic is needed at instance creation time

```
@ConversationScoped
public class Playlist {
    @Produces @Favourite @RequestScoped
    public Track getFavTrack() {
        return new Track(favTitle)
    }
    public void drop(@Disposes @Favourite Track t)
        { dosomecleanup(t); }
}
```

@Specializes

- 'Replaces' the Managed Bean of a superclass
- Bean must extends the superclass
- possible to specialize Producer Methods
- or even EJBs:

```
@Stateless
```

```
public class UserSvcFacade implements UserSvc
{ ... }
```

```
@Stateless @Mock @Specializes
```

```
public class MockUserSvcFacade extends
UserSvcFacade
{ ... }
```

@Alternative

- Swap Implementations for different installations
- Kind of an optional override of a bean

@Alternative

```
public class MockMailService  
implements MailService { ... }
```

- Disabled by default

```
<beans>
```

```
    <alternatives>
```

```
        <class>org.mycomp.MockMailService</class>
```

```
    ...
```

@Stereotype

- Stereotypes are used to combine various attributes and roles
 - A default scope
 - A default naming scheme
 - Set of InterceptorBindings and @Alternative behaviour
 - can be meta-annotated with other Stereotypes!

@Stereotype example

```
@Stereotype
```

```
 @ApplicationScoped
```

```
 @Transactional
```

```
 @Secured
```

```
 @Target(TYPE)
```

```
 @Retention(RUNTIME)
```

```
public @interface Service {}
```

Interceptors

- An Interceptor decouples technical concerns from business logic
- Applying cross cutting concerns to beans
- JSR-299 allows you to write your own interceptors
- Interceptors are treated as being @Dependent to the intercepted class

Interceptor usage

- Interceptor annotations can be applied on method or class level

```
@ApplicationScoped
public class UserService {
    @Transactional
    public storeUser(User u) {
        ...
    }
}
```

InterceptorBinding Type

- InterceptorBindings are used to identify which Interceptors should be applied to a bean

```
@InterceptorBinding
@Retention(RetentionPolicy.RUNTIME)
@Target( { ElementType.TYPE,
          ElementType.METHOD } )
public @interface Transactional { }
```

The Interceptor Impl

@Interceptor @Transactional

```
public class TransactionalInterceptor {  
    private @Inject EntityManager em;  
  
    @AroundInvoke  
    public Object invoke(InvocationContext context)  
        throws Exception {  
        EntityTransaction t = em.getTransaction();  
        try {  
            if(!t.isActive()) t.begin();  
            return context.proceed();  
        } catch(Exception e) {  
            .. rollback and stuff  
        } finally {  
            if(t != null && t.isActive())  
                t.commit();  
        }  
    }  
}
```

Enabling Interceptors

- Interceptors need to be **enabled manually** in beans.xml
- You can define the **order** in which multiple Interceptors stack

```
<beans>  
    <interceptors>  
        <class>org.mycomp.Secured</class>  
        <class>org.mycomp.Transactional</class>  
    </interceptors>  
</beans>
```

Events

- Observer/Observable pattern
- Inject a Event producer

```
private @Inject Event<UserLoggedIn> loginEvent;  
private @Inject User usr  
loginEvent.fire( new UserLoggedIn(user) );
```

- Event Consumer

```
void onLogin(@Observes UserLoggedIn ule) {  
    ule.getUser().getName(); ...  
}
```

- Attention: don't use private observer methods!

Portable Extensions

Writing own Extensions

- CDI Extensions are **portable**
- and **easy to write!**
- Are **activated by simply dropping them into the classpath**
- CDI Extensions are based on `java.util.ServiceLoader` Mechanism

Extension Lifecycle

- Extensions picked up and instantiated at Container startup
- Container sends 'system events' which all Extensions can @Observes:
 - BeforeBeanDiscovery
 - ProcessAnnotatedType
 - ProcessInjectionTarget
 - AfterBeanDiscovery
 - AfterDeploymentValidation
 - BeforeShutdown

A sample Extension

- <https://github.com/struberg/InterDyn>

```
public class InterDynExtension
implements Extension {
public void processAnnotatedType(
    @Observes ProcessAnnotatedType pat) {
    for (InterceptorRule rule : interceptorRules)
        if (beanClassName.matches(rule.getRule())){
            AnnotatedType at = pat.getAnnotatedType();
            at= addInterceptor(at, rule);
            ...
            pat.setAnnotatedType(at);
    }
    ...
}
```

Register the Extension

- Extensions need to get registered for the ServiceLoader
- Create a file
`META-INF/services/javax.enterprise.inject.spi.Extension`
- Simply write the Extensions classname into it
`com.mycomp.MyFirstExtension`

Popular Extensions

- Apache MyFaces CODI
<http://myfaces.apache.org/extensions/cdi>
- JBoss Seam3
<http://seamframework.org/Seam3>
- CDISource
<https://github.com/cdisource>

Common Pitfalls & New Programming Patterns

AmbiguousResolutionException

- Happens if multiple Bean<T> serve the same InjectionPoint.
- MenuItem example:

```
public class MenuItem implements Serializable
{
    private String id;
    private String name;
    private MenuItem parent;
    private MenuItem[ ] childs;
    ...
}
```

The MenuItem Producer

- We use a producer method to create the menu tree

```
@ApplicationScoped
public class MenuProducer {
    private @Inject MenuService menuSvc;
    @Produces @SessionScoped
    public MenuItem createMenuItem(User usr) {
        return menuSvc.getMenuOfUser(usr);
    }
}
```

@Typed

- Defines the Java Type which should be used for that bean
- Possible to 'disable' a bean with `@Typed()` to prevent AmbiguousResolutionExceptions

```
@Typed() // basically disables this Bean
public class MenuItem implements
Serializable {
```

- handy for subclasses which should NOT conflict with their parent class types

Explicitly @Typed

```
@ApplicationScoped  
public class TrackReadOnlyService {  
    public Track readTrack(int id) {...}  
}
```

```
@Typed(TrackReadWriteService.class)  
@ApplicationScoped  
public class TrackReadWriteService  
extends TrackReadOnlyService {  
    public void writeTrack(Track t) {...}  
}
```

Cache cleaning via Events

- If user changes language or logs in, then we need to change the menu

```
@SessionScoped
public class Menu {
    private @Inject MenuItem parentMenu;
    protected reloadMenu(@Observes
UserSettingsChangedEvent uscE) {
        parentMenu = menuSvc.loadMenu();
    }
}
```

Typesafe Configuration

- Config without properties or XML files
- Just create an Interface or default config class

```
public interface MyConfig{  
    String getJdbcUrl();  
}
```

- Later just implement, `@Specializes`, `@Alternative`, `@ProjectStageActivated`, `@ExpressionActivated` your config impl.

@Nonbinding

- **@Nonbinding** excludes annotation parameters from the comparison

```
@InterceptorBinding  
@Retention(RetentionPolicy.RUNTIME)  
@Target( { TYPE, METHOD } )  
public @interface Transactional {  
    @Nonbinding boolean requiresNew()  
        default false;  
}
```

Behaviour Mutation

- Difference between cached and uncached version of the same service:

@Qualifier

```
@Target( {TYPE, FIELD, METHOD} )  
@Retention(RetentionPolicy.RUNTIME)  
public @interface Cached {  
}
```

The Services

```
@ApplicationScoped  
public class BusService {  
    Bus getBus(int id) {..}  
}
```

@Cached

```
@ApplicationScoped  
public class CachedBusService  
extends BusService { .. }
```

Dynamic Resolving

```
@Inject @Any
private Instance<BusService> busSvcSource;
private BusService busSvc;

..
@PostConstruct
protected init() {
    busSvc = busSvcSource.select(
        user.isAdmin()
            ? new AnnotationLiteral<Default>() {}
            : new AnnotationLiteral<Cached>() {}
        ).get();
}
```

Multi Tenant Setup

- Same trick with Instance + combined with producer method

```
@Inject @Any
```

```
Instance<ServiceX> svcXSource;
```

```
@Produces
```

```
@TenantSpecific
```

```
@RequestScoped
```

```
public ServiceX getSvcX(Tenant t) {  
    return svcXSource.select(...).get();  
}
```

What's New in CDI-1.1

- Globally enabled Interceptors and Alternatives
- XML configuration
- @Disposes for producer fields
- Clarifies some AnnotatedType behaviour
- @Veto + optional beans
- Relax Serialization rules
- @EarApplicationScoped vs
@WebApplicationScoped
- <https://issues.jboss.org/browse/CDI>

Documentation
